Telehealth Rheumatology Presenting

1. SCOPE

1.1. Marshfield Clinic Health System Telehealth Presenters

2. DEFINITIONS & EXPLANATIONS OF TERMS

2.1. Articular disease: Of or relating to a joint or joints: the articular surfaces of bones.
2.2. Ataxia: a gait that lacks coordination with instability
2.3. Cricoid cartilage: ring-shaped cartilage of the larynx
2.4. Distal: situated away from the center of the body or from the point of attachment
2.5. Hypertonia: increased tone
2.6. Hypotonia: decreased tone
2.7. Palpation: method of feeling with the fingers or hands during a physical examination.
2.8. Passive range of motion: movement of the joint through range of motion with no effort from the patient
2.9. Proximal: situated nearer to the center of the body or the point of attachment.
2.10. Weakness: impaired strength
2.11. ROM- Range of Motion
2.12. Aortic valve: is at the second right intercostal space at the sternal border.
2.13. Pulmonic valve: is at the second left intercostal space at the sternal border.
2.14. Tricuspid valve: is at the fifth left intercostal space at the sternal border.
2.15. Point of Maximal Impulse (PMI): is at the apex; fifth left intercostal space at the midclavicular line
2.16. Costal Margin: lower (abdominal) border of the front of the rib cage formed by the costal cartilages of ribs 7 to 10.
2.17. Pulsatile: throbbing
2.18. RUQ: Right upper Quadrant
2.19. Homan’s sign: discomfort behind the knee on forced dorsiflexion of the foot
2.20. GCA: Giant Cell Arteritis. Causes swelling and thickening of the small temporal artery under the skin

3. PROCEDURE BODY

All clinical staff responsible for the presenting of patients to Rheumatology Services or any provider who may need a component of a Rheumatology physical exam shall be proficient in providing neurological exam data via Telehealth technologies while working within scope of practice.

3.1. Pre-Consult Preparation
   a. See Core Telepresenting Procedure

When document is printed it becomes an uncontrolled copy. Please refer to DCS system for most current version.
b. Be sure to select the appropriate provider visit and the necessary package that coincides with the visit

- Height
- Weight
- Blood pressure
  - Refer to ACO Blood Pressure Screening Process
  - For patients with GCA, collect blood pressures on bilateral thighs and bilateral upper extremities
- Pulse
- Temperature

c. Fill out Rapid 3 form and enter total score results in Dashboard

- Instructions for filling out Rapid 3 Form

d. Have patient fill out Pain Questionnaire under prep tab in Document Manager for Dr. Ziegenbein’s patients

3.1. Provider Directed Physical Exam:

a. Gait Assessment

- Provider will instruct the patient to walk across the room or down the hall, then turn and come back observing posture, balance, the arms swinging at the sides, and turns are accomplished smoothly.
- Provider may request patient to tandem walk (heel-to-toe) revealing an ataxia not previously observed.

b. Oral Cavity

- Be prepared to use the handheld camera to assist the provider to inspect the mouth for ulcers.

c. Neck Assessment

- Thyroid Exam:
  - With the hand held camera or room camera, assist the provider to inspect the neck for the thyroid gland.
  - Instruct the patient to tip their head back in a sniffing position.
  - Direct peripheral lighting with goose neck lamp downward from the tip of the patient’s chin to allow the provider to inspect the region below the cricoid cartilage (located just below the thyroid cartilage [Adam’s apple]). The thyroid is located just below the cricoid cartilage. The lower border of the large thyroid gland will be outlined with peripheral lighting.
  - With the patient’s head tipped back, instruct the patient to sip some water.
  - The provider will be watching for upward movement of the thyroid gland, noting its contour and symmetry.
  - In a similar fashion, repeat the exam to examine the left lobe.
  - Report Surface (lumpy or hard), enlargement (right > left), consistency of the gland, along with any nodules or tenderness
- If the provider requests the Telehealth nurse to palpate the thyroid gland:
  - Stand behind the patient and ask the patient to slightly flex the neck to relax the muscles.
- Place the fingertips of both hands on either side of the trachea just below the cricoid cartilage.
- With the patient’s head tipped back, instruct the patient to sip some water.
- Feel the thyroid isthmus rise up under the finger pads. Please note it is often not palpable.
- Displace the trachea to the right with the fingers of the left hand; with the right-hand fingers, palpate laterally for the right lobe of the thyroid in the space between the displaced trachea and the relaxed sternomastoid muscle.
- Find the lateral margin.
- In a similar fashion, repeat the exam to examine the left lobe.
- Report surface (lumpy or hard), enlargement (right > left), consistency of the gland, along with any nodules or tenderness.

d. Lung Assessment
- Position patient so his or her posterior side is to the room camera
- Place limited pressure with the digital stethoscope at the six posterior lung fields for two complete breaths or until prompted by provider to switch landmarks.
- Begin with upper lobes of lung, moving the diaphragm of the stethoscope in a ladder-like pattern, from one side to the other. This will allow the provider to identify patterns of breath sounds and compare symmetric areas of the lungs.
- Position patient with anterior side facing the room camera. Use the digital stethoscope to auscultate two anterior lung fields or until prompted by provider to switch landmarks.

e. Heart assessment
- Position patient’s anterior side to room camera and apply limited pressure to the digital stethoscope to auscultate in the four landmarks below.
  - Aortic valve
  - Pulmonic valve
  - Tricuspid valve
  - Mitral Valve/Point of Maximal Impulse (PMI)
Watch the provider for cues to move to the next landmark.

f. Abdominal assessment: Be prepared to use both room camera and handheld camera for provider directed abdominal assessment.

Instruct patient to indicate if they experience any discomfort during palpation. Watch for non-verbal signs of discomfort e.g. patient pulls away, facial expressions.

May try the following measures to enhance complete muscle relaxation:
- Bend patient’s knees, Teach person to breathe slowly, Engage patient in conversation

- **General Abdominal Palpation Technique:**
  - Use flat part of hand or pads of fingers, not fingertips.
  - Fingers should be together, avoid sudden jabs.
  - Use light (push down 1cm) to deeper (push down 5 to 8 cm) pressure
  - Report any abnormal enlargement, tenderness or masses to the provider
  - If you feel a mass, report to provider: location, size, shape, consistency (soft, firm, hard), Surface (smooth, nodular), Mobility, pulsatile, and tenderness

- **Liver Palpation Technique:**
  - Place left hand under patient’s back parallel to 11th and 12th Ribs and lift up to support abdominal contents
  - Place Right hand on RUQ with fingers parallel to midline
  - Push down deeply (5cm to 8cm) under the right costal margin
  - Ask patient to breathe slowly
  - With every exhalation, move your palpating hand up 1 or 2 cm to feel for the edge of the liver
Note: You may feel a firm, regular ridge, but often times the liver is not palpable and you feel nothing firm.

g. Joint assessment/palpation
   - Using room camera or handheld video camera show provider joints so provider can access for swelling and redness
   - Palpate each joint, including its skin for temperature, and its muscles for bony articulation, and area of joint capsule
     - Access joints for heat, tenderness, swelling, bogginess or masses
     - Compare one side to the other

h. Range of Motion
   - Ask patient for active (voluntary) ROM by modeling the movements yourself as appropriate
   - If you see a limitation, gently attempt passive ROM
     - Limitation is ROM is the most sensitive sign of joint disease
     - Articular disease, as in arthritis, produces swelling and tenderness around the whole joint and it limits ROM across all planes in both active and passive motion

i. Muscle Tone
   - Provider will direct Telepresenter to assess muscles and joints
     - Telepresenter puts joints through normal range of motion
     - Systematic evaluation proceeds from:
       - shoulder, elbow, wrist, and fingers in upper extremities
       - hip, knee and ankle in lower extremities
     - Compare findings from left side to right side
   - Report any findings or variations in muscle tone to provider (e.g. Normal, hypertonia or hypotonia)

j. Muscle Strength: Not all muscles may be assessed individually, but major groups are assessed; more detailed examination may be conducted if deficits are noted in a particular area
   - Muscle Strength Grading:
     - Grade 5 Full ROM against gravity, full resistance
     - Grade 4 Full ROM against gravity, some resistance
 Grade 3 Full ROM with gravity
 Grade 2 Full ROM with gravity eliminated (passive motion)
 Grade 1 Slight Contraction
 Grade 0 No Contraction

☐ Compare functional level of each muscle/muscle group to functional level of same muscle/muscle group on opposite side (e.g. compare muscle strength of Right Bicep to Left Bicep)

☐ Pattern of muscle extremity evaluation includes both proximal and distal muscle groups

☐ Provider instructs patient to move muscles actively against gravity and then against resistance provided by Telepresenter.

☐ Provider decides muscles/muscle groups to be assessed and directs Telepresenter through assessment of muscle strength.
   Make your directions to patient clear. Demonstrate movements as necessary.
   See table below for muscle assessment details

☐ Upper Extremity
   Deltoid C 5, 6
   Biceps C 5, 6
   Triceps C 6, 7, 8
   Wrist flex/extend C7, 8
   Grip C7, 8, T1
   Interossei (keeping fingers spread apart) C 8, T 1

☐ Lower Extremity
   Iliopsoas L 1, 2, 3
   Hip adductors L-2, L-3, L-4
   Quadriceps L 2, 3, 4
   Anterior Tibialis L 4, 5
   Gastrocnemius S 1, 2
   EHL (Big toe extension) L 5

<tbody>
<tr>
<td><strong>Shoulder Serratus Anterior C 5, 6, 7</strong></td>
<td>Patient pushes against a wall with arms extended horizontally in front of them. Extend your arms parallel to floor and push with your palms against wall.</td>
<td>Observe scapula for increased prominence of scapular tip (winging). Normally, each scapula is close to thorax. Winging suggests serratus anterior muscle weakness.</td>
<td><img src="image1.png" alt="Image" /></td>
</tr>
<tr>
<td><strong>Shoulder Deltoid C 5, 6</strong></td>
<td>Instruct patient to flex elbow slightly and move upper arm away from their body. (Alternative, ask patient to position his or her arms like chicken wings.)</td>
<td>Try to push abducted upper arms down against resistance. Patient attempts to abduct his arm against resistance. Deltoid contraction can be seen and palpated.</td>
<td><img src="image2.png" alt="Image" /></td>
</tr>
<tr>
<td><strong>Upper Arm Biceps C 5, 6</strong></td>
<td>Flex your elbow and make a muscle with your palm parallel to shoulder.</td>
<td>Try to pull flexed forearm open. On attempts to flex forearm against resistance, bicep muscle contraction can be seen and palpated.</td>
<td><img src="image3.png" alt="Image" /></td>
</tr>
<tr>
<td><strong>Upper Arm Brachioradialis C5, 6</strong></td>
<td>Flex your elbow and make a muscle while your palm is pointed at midline</td>
<td>Try to pull flexed forearm open. On flexion at semi-pronated forearm (thumb up) against resistance, muscle contraction can be seen and palpated.</td>
<td><img src="image4.png" alt="Image" /></td>
</tr>
<tr>
<td><strong>Upper Arm Triceps C6, 7, 8</strong></td>
<td>Push me away with that same arm.</td>
<td>Provide resistance, thus trying to prevent extension. On attempts to extend partially flexed forearm against resistance, of</td>
<td><img src="image5.png" alt="Image" /></td>

</tbody>
</table>

#### k. Sensation

- Provider determines patient’s ability to perceive various types of sensations.
- Compare left and right sides of body as well as sensory perceptions at distal and proximal portions of all extremities. Testing proceeds in an orderly fashion.
- Body areas commonly evaluated include face, neck, deltoid regions, forearm, hands (top side), chest, abdomen, thighs, lower legs, and feet (top surface).
- Sensory function is rated according to following scale:
• 2: normal
• 1: present, but diminished (abnormal)
• 0: absent

☑ Sensation Assessment

• Provider determines areas to be assessed and directs telepresenter assessment. Following areas may/may not be assessed:
  - posterior aspect of the shoulders (C4)
  - lateral aspect of the upper arms (C5)
  - medial aspect of the lower arms (T1)
  - tip of the thumb (C6)
  - tip of the middle finger (C7)
  - tip of the pinky finger (C8)
  - thorax, nipple level (T5)
  - thorax, umbilical level (T10)
  - upper part of the upper leg (L2)
  - lower-medial part of the upper leg (L3)
  - medial lower leg (L4)
  - lateral lower leg (L5)
  - sole of foot (S1)

• Instruct patient to close eyes

• Instruct patient to tell provider if they notice a difference in strength of sensation on each side of their body

• Touch one body part followed by corresponding body part on other side (e.g., right shoulder then left shoulder) with same instrument. This allows patient to compare sensations and note asymmetry.

• Light touch
  - A wisp of cotton, alcohol wipe, gauze, brush etc. is used to lightly touch various areas of skin.
  - Patient tells provider/you if they can feel light touch in area being assessed.

I. Deep Tendon Reflexes:
  □ Refer to Reflex Guide
  □ Encourage patient to relax.
  □ Position limbs properly and symmetrically. Hold reflex hammer loosely between your thumb and index finger so that it swings freely in an arc within limits set by your palm and other fingers.
With wrist relaxed, strike tendon briskly using a rapid wrist movement. Reflex response depends partly on the force of your stimulus. Compare response of one side with other.

Clinician will grade reflexes based on following scale:

- 4+= Very brisk, hyperactive with clonus (spasmodic alternation of muscular contraction and relaxation).
- 3+= Brisker than average; possibly but not necessarily indicative of disease.
- 2+= Average; normal
- 1+= Somewhat diminished; low normal
- 0= No response/ absent.

Radial  
Biceps  
Triceps  
Knee  
Ankle

Hoffmann’s Sign: Tap or flick the nail of the middle finger to produce flexion of the index finger to the thumb
